# Transfer reactions with Be-Li isotopes near the drip-line

LISE Workshop 2024

M. Lozano-González, A. Matta, B. Fernández-Domínguez, J. Lois-Fuentes, F. Delaunay on behalf on the E748 collaboration

IGFAE-USC and LPC-Caen

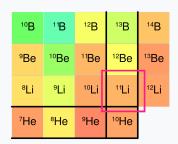

### Overview of the exotic Be-Li region

Be and Li isotopes close to the neutron drip line have been extensively studied due to their exotic properties.

Two prime examples can be showcased:

**"Li** is a neutron-rich nuclei displaying a 2n **halo** structure.

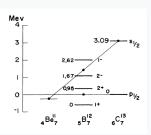

### Overview of the exotic Be-Li region

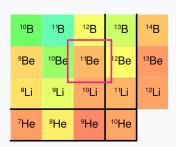

Be and Li isotopes close to the neutron drip line have been extensively studied due to their exotic properties.

Two prime examples can be showcased:

<sup>11</sup>Be presents parity inversion: g.s has **positive** parity when negative expected.

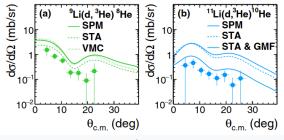

I. Talmi and I. Unna, PRL 4 (1960).

# Recently gathered information

During the MUST2 @ RIKEN campaign, an unexpected **reduction** of the cross-section was observed in  $^{9,11}\text{Li}(d, ^3\text{He})^{8,10}\text{He}$  reactions.

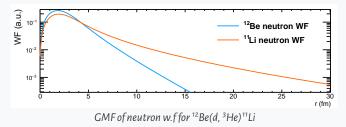

A. Matta et al., PRC 92 (2015).

### Possible explanations:

• Role of the many-body interactions.

# Recently gathered information

During the MUST2 @ RIKEN campaign, an unexpected **reduction** of the cross-section was observed in <sup>9,11</sup>Li(d, <sup>3</sup>He)<sup>8,10</sup>He reactions.

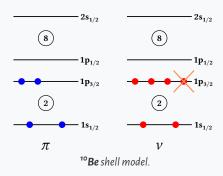

### Possible explanations:

- Role of the many-body interactions.
- Overestimation of the nuclear overlap  $\langle ^{9,11}\text{Li}|^{8,10}\text{He}\rangle$ .

Collect more  $d\sigma/d\Omega$  data!

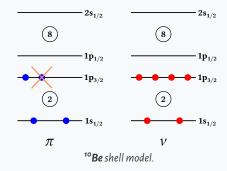

**E748** at GANIL during the MUST2@LISE campaign. Neutron and proton removal reactions from <sup>10,12</sup>Be beams have been performed to probe key nuclei:

•  ${}^{10}$ Be(d, t)  ${}^{9}$ Be: Benchmark reaction. n-occupancy in  $p_{3/2}$ .

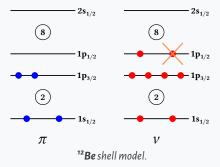

**E748** at GANIL during the MUST2@LISE campaign. Neutron and proton removal reactions from <sup>10,12</sup>Be beams have been performed to probe key nuclei:

- ${}^{10}$ Be(d, t) ${}^{9}$ Be: Benchmark reaction. n-**occupancy** in  $p_{3/2}$ .
- ${}^{10}$ Be(d,  ${}^{3}$ He) ${}^{9}$ Li:  $p_{3/2}$  proved but on the proton side.

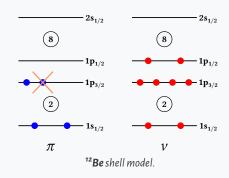

**E748** at GANIL during the MUST2@LISE campaign. Neutron and proton removal reactions from <sup>10,12</sup>Be beams have been performed to probe key nuclei:

- ${}^{10}$ Be(d, t) ${}^{9}$ Be: Benchmark reaction. n-**occupancy** in  $p_{3/2}$ .
- $^{10}$ Be(d,  $^{3}$ He) $^{9}$ Li:  $p_{3/2}$  proved but on the proton side.
- $^{12}$ Be(d, t) $^{11}$ Be: higher orbital  $p_{1/2}$ .

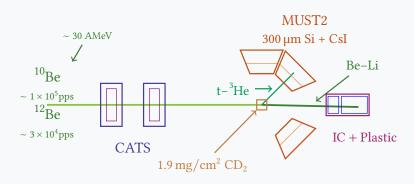

**E748** at GANIL during the MUST2@LISE campaign. Neutron and proton removal reactions from <sup>10,12</sup>Be beams have been performed to probe key nuclei:

- ${}^{10}$ Be(d, t) ${}^{9}$ Be: Benchmark reaction. n-**occupancy** in  $p_{3/2}$ .
- $^{10}$ Be(d,  $^{3}$ He) $^{9}$ Li:  $p_{3/2}$  proved but on the proton side.
- $^{12}$ Be(d, t) $^{11}$ Be: higher orbital  $p_{1/2}$ .
- <sup>12</sup>Be(d, <sup>3</sup>He)<sup>11</sup>Li: same p-orbital as before.

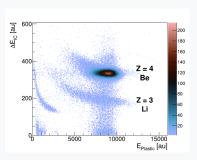

### Experimental setup for E748

Traditional **solid target** experiment @ D6. Below a sketch of the setup:

A **common** procedure is employed in all the reactions. Different gates are applied in a sequential manner, as follows:

1. **Heavy ID**: Only distinction in *Z*: separation of Be from Li residuals, but not along isotopic chain.

# A **common** procedure is employed in all the reactions. Different gates are

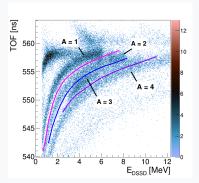

Light ID: Using only stopped particles in Si layer, but low TOF

resolution. Separation of t-3He

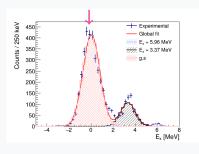

applied in a sequential manner, as follows:

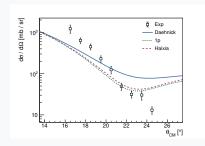

attained with kinematics!

Missing mass technique:  $E_{\text{beam}} + (E, \theta)_{\text{Lab}} \rightarrow \mathbf{E_x}$ 

Serves as a test of the analysis, allowing us to ascertain the **normalization** factors  $N_t$  and  $N_h$ .

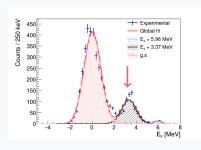

00000

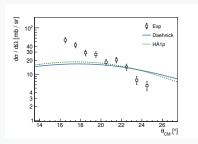

- Modern models (Haixia and DA1p) adjust better to the data.
- Failure at low and high angles.
- Overall agreement in magnitude.

Likely to be a miscalculation in efficiency

# Elastic: ${}^{10}\text{Be}(d,d){}^{10}\text{Be}$

Cross-section for the 1st excited state is also achievable.

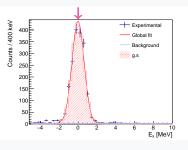

- Potential deformed in both Coulomb and nuclear parts
- Using B(E2) for other experiments.

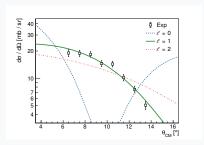

To be further investigated.  $\Rightarrow C^2S = 0.270(22)$  with Daehnick

# Neutron removal: ${}^{10}\text{Be}(d,t){}^{9}\text{Be}$

Only the **ground state** is accessible. Angular distributions are determined in the interval  $\theta_{CM} \in [5, 20]^{\circ}$ .

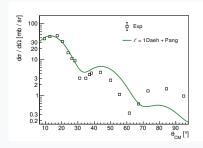

#### Theoretical calculations with DWBA:

- DAEHNICK + PANG OMPs.
- Only single-particle overlaps.
- Finite range calculation.

Best fit is 
$$\ell = 1$$
  
with  $j = 3/2$ .  
 $\Rightarrow C^2S = 1.522(44)$ 

# Neutron removal: <sup>10</sup>Be(d, t) <sup>9</sup>Be

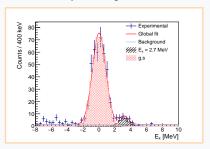

Another measurement is available in D.L Auton Nucl. Phys. A (1970). A reanalysis with our model is executed:

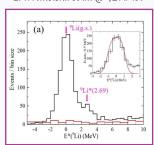

- No errors could be extracted
- Poor quality at large  $\theta_{CM}$
- $C^2S = 1.951(54)$

**E748** can be compared with a recent experiment carried out at the Acculinna facility. For the  $E_x$ :

#### Our experiment @ 30 AMeV

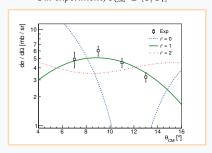

### E. Y. Nikolskii et al. @ 42 AMeV

Recently published: NIMPR B 541 (2023)

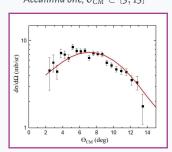

### Angular distributions for the **ground state** are extracted:

Our experiment,  $\theta_{CM} \in [6, 14]^{\circ}$ 

Again 
$$\ell = 1 \implies 3/2^-$$
.  
 $C^2S = 1.80(11)$ 

Acculinna one,  $\theta_{CM} \in [3, 13]^{\circ}$ 

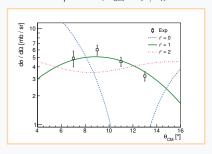

Original publication:  $C^2S = 1.74$ 

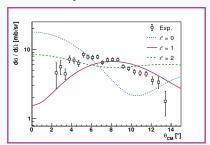

### Angular distributions for the ground state are extracted:

Our experiment,  $\theta_{CM} \in [6, 14]^{\circ}$ 

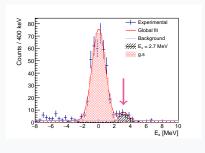

Again 
$$\ell = 1 \implies 3/2^-$$
.  
 $C^2S = 1.80(11)$ 

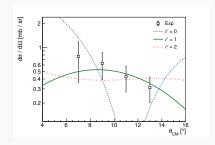

Reanalyis of Acculinna's data

$$\ell = 1 \implies C^2S = 3.13(6)$$
Different **input parameters** in the models!

A first excited state is also accesible.

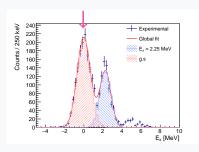

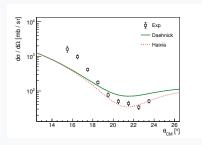

- **Best fit** is  $\ell = 1$
- Assuming j = 1/2
- Spectroscopic factor: 0.185(36)

# Elastic: $^{12}$ Be(d, d) $^{12}$ Be

Yet another validation method of the normalization.

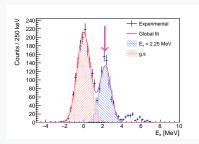

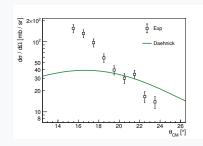

- Modern models (Haixia and DA1p) adjust better to the data.
- Failure at low and high angles.
- Overall agreement in magnitude.

Likely to be a miscalculation in **efficiency** 

# Elastic: $^{12}$ Be(d, d) $^{12}$ Be

Cross-section for the 1st excited state is also achievable.

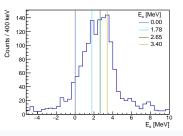

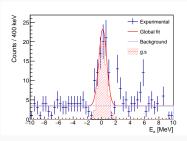

- Potential deformed in both Coulomb and nuclear parts
- Using B(E2) for other experiments.

To be further investigated.  $\Rightarrow C^2S = 0.519(30) \text{ with }$  Daehnick

# Challenging channels: $^{12}$ Be $(d, t|^3$ He $)^{11}$ Be|Li

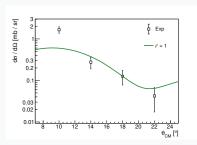

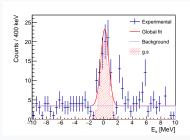

Left: (d,t); Right: (d, 3He)

• Strong inhibition of g.s

- Low cross-section ⇒ low counting
- Subject to **contamination**: hard to disentangle A = 3

# Challenging channels: $^{12}$ Be $(d, t|^3$ He $)^{11}$ Be|Li

(d, <sup>3</sup>He)

$$\Rightarrow C^2S = 0.510(85)$$
 with Daehnick

- Low cross-section ⇒ low counting
- Subject to **contamination**: hard to disentangle A = 3

### Conclusions and outlook

We investigated several proton and neutron pick-up reactions on <sup>10,12</sup>Be:

	Channel	Status	Pending
10Be	(d,d) (d,t) (d, 3He)		
12Be	(d,d) (d,t) (d,3He)		

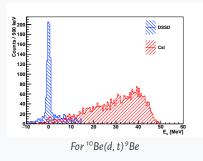

**Future prospects** 

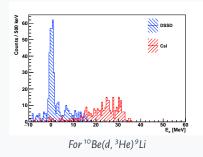

Thanks for your attention!	
And special thanks to the <b>E748</b> collaboration.	

### Csl on or off?

So far, studied excited states are compressed in the DSSD layer:

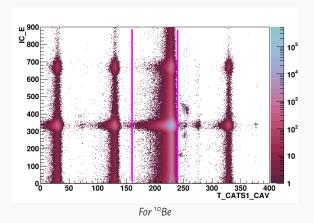

### Beam ID

### Using Caviar to CATS1 TOF and energy loss in IC

### Kinematic lines
